

NTA Health - information about our bio-resonance testing services.

At NTA we have been using bio-resonance testing in our natural health clinic for over 20 years and in recent times we have also offered remote testing (where we test a saliva sample you send to us) most recently for dogs as well as people.

Bio-resonance testing has been around since the 1970s. It is a non-invasive alternative medical technique based on the understanding that all particles of matter give off electromagnetic energy which can be measured as frequencies and detected by resonance reading equipment. The equipment determines which frequencies create a stress response for the test subject. It is possible for us to measure those frequencies from a saliva sample in addition to in-person testing, while some other clinics use blood or hair sample. We choose to use saliva because it carries hormones, enzymes, proteins and antibodies as well as all the frequencies of things thus providing what we believe to be a more informative sample for testing on our system.

In addition to health testing, Bio-resonance systems have been used by many sports teams to aid the treatment of injuries and help athletes maximise their performance, most notably the Chinese Olympic team in 2008 and the AC Milan football team. The high specification device that we use at NTA is certified in Europe as a class 2 medical device.

We find that most people who come to us for help have already seen their GP or vet multiple times and have been tested using conventional blood tests and scans without discovering the cause or cure for their health problem. Alternatively, they might be taking medication that is causing side effects and be interested in a different way of managing the problem. Naturopaths look at health holistically, using different diagnostic methods, including bio-resonance systems.

If you have a test with us, the information and suggestions that we will provide afterwards are not intended to replace standard medical advice. You should continue with all medication and recommendations for testing from your main healthcare provider. Nothing that we might suggest is contraindicated with mainstream medicines or procedures, unless specifically stated otherwise.

You may decide to show your GP or Vet the results report that we will send you after your test and they might take the information we found and use it to inform their practice. In fact, some GPs actually recommend our service and get tested themselves! However, the majority will tell you that the information cannot be correct as they are unlikely to know anything about bio-resonance testing. They will usually only be aware of laboratory testing of blood or saliva testing to check hormone levels. More than that, medical and veterinary training focuses almost exclusively on pharmaceutical medicines for treatment, teaching that traditional medicines like herbal and homeopathic do not work (which at least 9 million people in the UK disagree with), so they are likely to think that we are offering a service that has no value.

We help hundreds of people every year with our test results and treatment suggestions and we are proud to say that over 90% of our new clients come via personal recommendation. If you or your pet has a health condition your GP or Vet haven't been able to help with, then we hope that you will decide to give our service a try and see the rewards for yourself.

Thanks for reading!
